

ABSTRACT OF THE DISCLOSURE

A receiving apparatus and a preset station setting method, in which even when a reception area is changed, the latest preset stations which can be received are always held, and when the reception area is not changed, the preset stations can be protected. Receiving states of the preset stations are checked. If it is determined that the receiving states of all of the preset stations are deteriorated, the preset stations are rearranged. When rearranging the preset stations, a plurality of stations in a predetermined band are received and the stations are arranged into the preset stations in the order of goodness of the receiving state. When the station in the good receiving state cannot be detected, the conventional preset stations are maintained.
